

0) Before you start

Download and unzip the **fix_stuff.zip** to your computer. Make a venv and start the venv.

Make sure **pict.py** is in the same dir as **oopsql.py** and the file **movies.db**.

In this ZIP you find:

- 2 python scripts
- 1 database file
- the database ERD

You may need to install some libraries along the way.

Then **fix** the issues below one by one, starting at no. 1.

Make a comment **# FIXED** above each line where you fixed or changed things.

Make the screen dumps and **submit** your solutions to BB.

1) Something's wrong with Potter

Run and ask **oopsql.py** for *potter* in 2012. The output of the SQL statement should be 4 rows. But why is it zero?

```
(venv) victorpeters@MBP-HXWP90P6KD tbff % python oopsql.py
What title? potter
Year? 2012
[]
(venv) victorpeters@MBP-HXWP90P6KD tbff %
```

Fix this in the code of the class **MoviesDb**. The output should then be:

```
(venv) victorpeters@MBP-HXWP90P6KD tbff % python oopsql.py
What title? potter
Year? 2012
[{'id': 2271208, 'title': 'Open Minds: Chris Potter Underground', 'year': 2012},
 {'id': 2658192,
  'title': 'A Haunting on Potter Street: The Potter Street Station',
  'year': 2012},
 {'id': 4568300, 'title': 'Pottery Poetry', 'year': 2012},
 {'id': 8443702,
  'title': 'Harry Potter and the Untold Stories of Hogwarts',
  'year': 2012}]
(venv) victorpeters@MBP-HXWP90P6KD tbff %
```

Hand in...

Make a screen dump of the part of the code that you changed. Name this screen dump **oops.png**.

2) Too much Potter

When we run **pict.py** it should open a PyQt6 GUI, but instead the terminal asks for *What title?*.

```
(venv) victorpeters@MBP-HXWP90P6KD tbff % python pict.py  
What title? █
```

After giving the answers, the GUI shows up and works, almost.

Why does it ask these questions in the terminal before opening the GUI? That's not supposed to happen!

It should open the GUI straight away. **Fix this.**

Hand in...

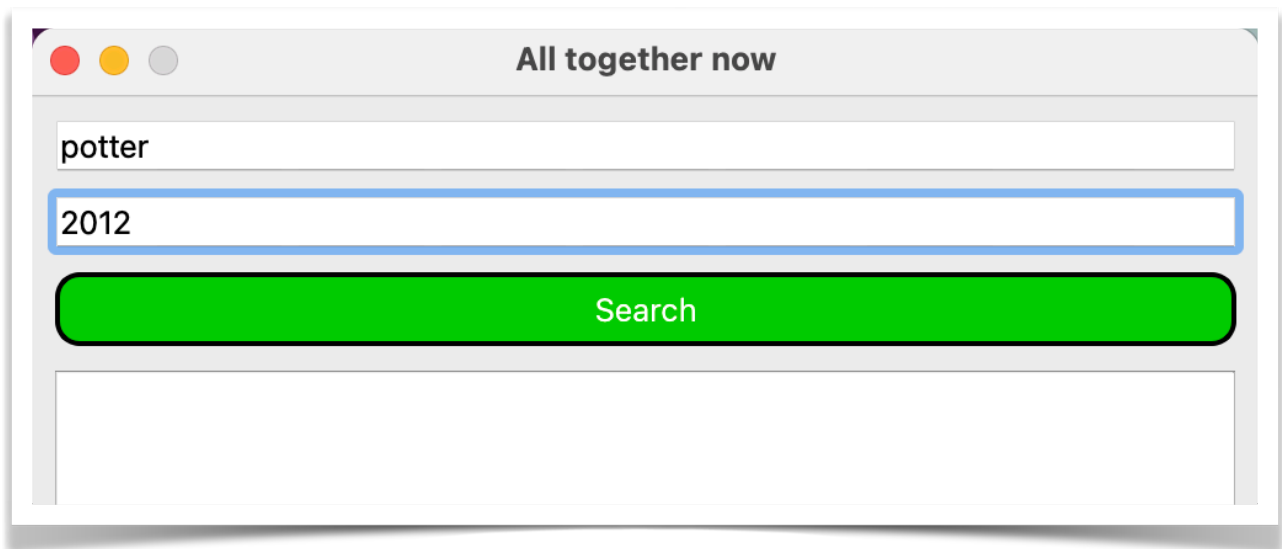

Make a screen dump of the part of the code that you changed. Name this screen dump **pict.png**.

3) No Potter at all

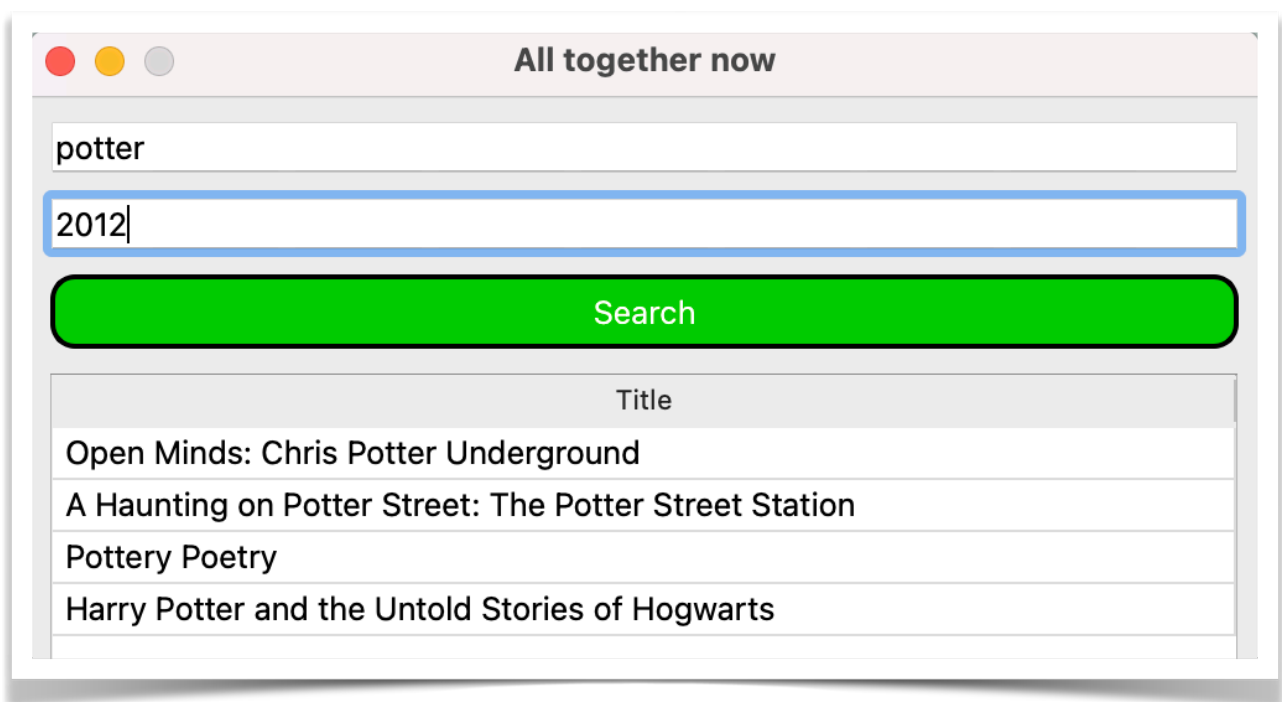

If you haven't fixed issue no. 2, **fix that first**.

If the GUI of **pict.py** shows up, you fill in the two fields and click the **Search** button, but nothing happens. Bugger.

All code is working correct. Only one line of code is missing. **Fix this**.

Results should be like:

Hand in...

Make a screen dump of the part of the code that you changed. Name this screen dump **gui.png**.

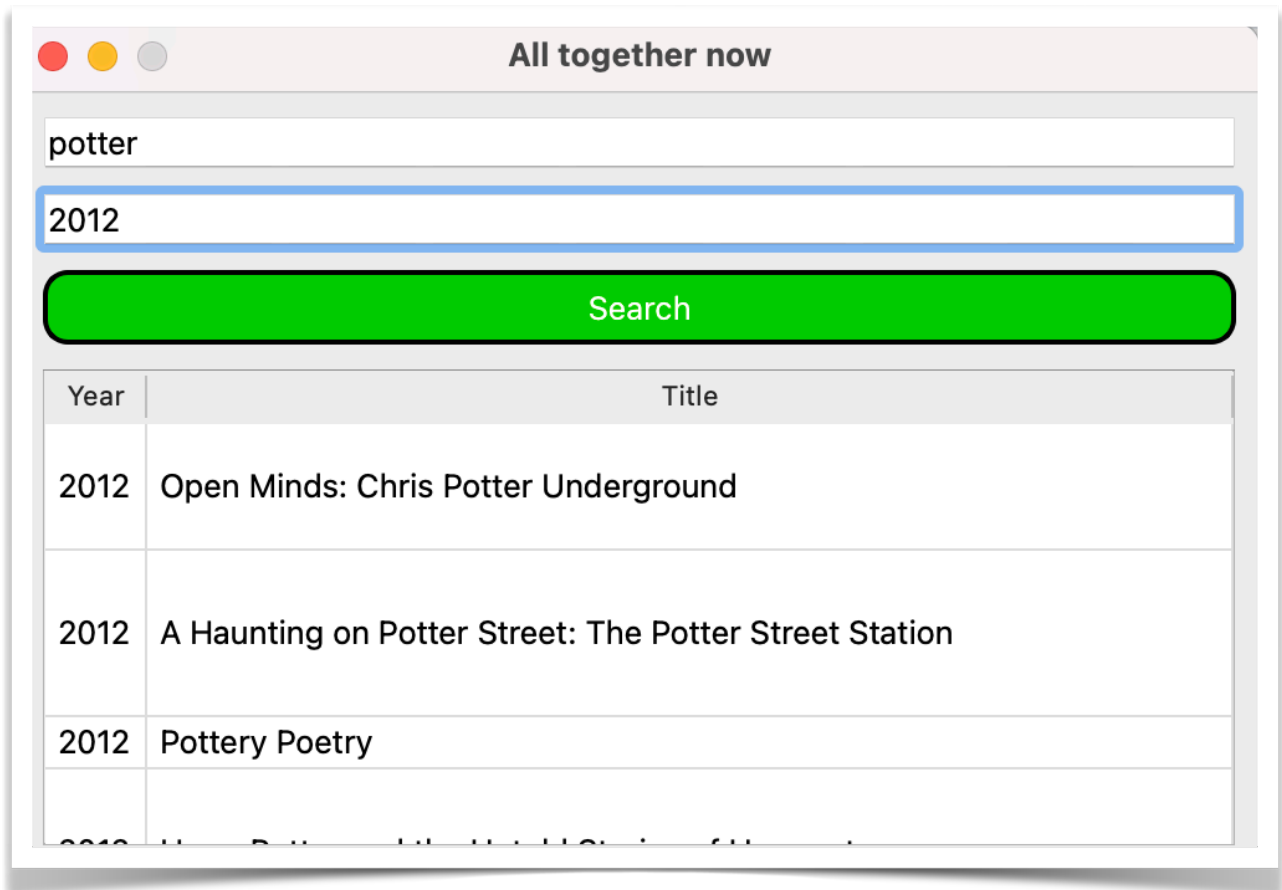

4) More than Potter

If you haven't fixed issue no. 2, **fix that first**.

Can you change the **pict.py** in a way that the output in `QTableWidget` shows 2 columns, where the first column shows the *Year* and the second column shows the *Title*? See image below.

Make sure that the horizontal header in top also show this extra column.

Pointer: a `QTableWidgetItem` can only show strings, not integers.

Hand in...

Make a screen dump of the part of the code in **pict.py** that you changed. Name this screen dump **table.png**.

Hand in ...

Hand in your edited **pict.py** file.

What to submit

Submit the following script files:

- **oops.png** – for assignment 1
- **pict.png** – for assignment 2
- **gui.png** – for assignment 3
- **table.png** – for assignment 4
- **pict.py** – your altered Python script
